Excerpt: . part of the chlorine had acted upon the alkali to form chloride and chlorate. 21. It would seem as if I were unacquainted with Dr. Granville s paper upon this subject, in the Quarterly Journal of Science, p. 371, were I to close my remarks without taking any notice of it. Unfortunately Dr. Granville has mistaken M. Labarraque s direction, and by passing chlorine, to complete saturation, through the carbonate, instead of using the quantities directed, has failed in obtaining Labarraque s really curious and very important liquid; to which, in consequence, not one of his observations or experiments applies, although the latter are quite correct in themselves. Royal Institution, Sept. 3, 1827. Anhydrous Crystals of Sulphate of Soda*. If a drop of a solution of sulphate of soda be placed upon a glass plate and allowed to evaporate spontaneously, it will leave crystals which may be distinguished by their form and ultimate efflorescence, as being the salt in question. Most of the potash and soda salts may be distinguished as to their base by such an experiment. They are easily converted into sulphates by a drop or two of sulphuric acid and ignition, and then, being dissolved and tried as above, will yield crystals which may be known by their forms, and more especially by their efflorescence if of soda, and their unchangeable state if of potash. This test is, however, liable in certain circumstances to uncertainty, arising from a curious cause....
